

#### ABSTRACT OF DISCLOSURE

An air conditioner including a cabinet, a partition plate provided in the cabinet to partition an internal space of the cabinet, and an air inlet port and an air outlet port provided on the cabinet to draw and discharge indoor air into and from the cabinet, respectively. The air conditioner further has an evaporator placed adjacent to the air inlet port, a fan to draw the indoor air into the cabinet through the air inlet port, an air guide duct to guide the indoor, and an air discharging duct supported on the partition plate adjacent to the air guide duct. Because the air discharging duct is supported on the partition plate, the air conditioner prevents the air discharging duct from being displaced from a desired position regardless of a vibration or impact applied to the air discharging duct. Thus, the assembling process of the air conditioner is simplified.
